

# SmartSky Networks

## We are SmartSky ready

Satcom Direct® and SmartSky Networks have teamed up to deliver the new standard for air-to-ground (ATG) connectivity. With blazing-fast 4G LTE technology, you get a low-latency, airborne Wi-Fi connection that delivers streaming video, responsive internet access, email, voice calls, and text messaging – in real-time, at speeds rivaling that of terrestrial broadband connections.

SmartSky leverages the proven performance of a 4G LTE beamforming-based wireless platform with the most substantial radio spectrum ever deployed in the aviation industry - all built upon the low-latency foundation of a secured air-to-ground network.

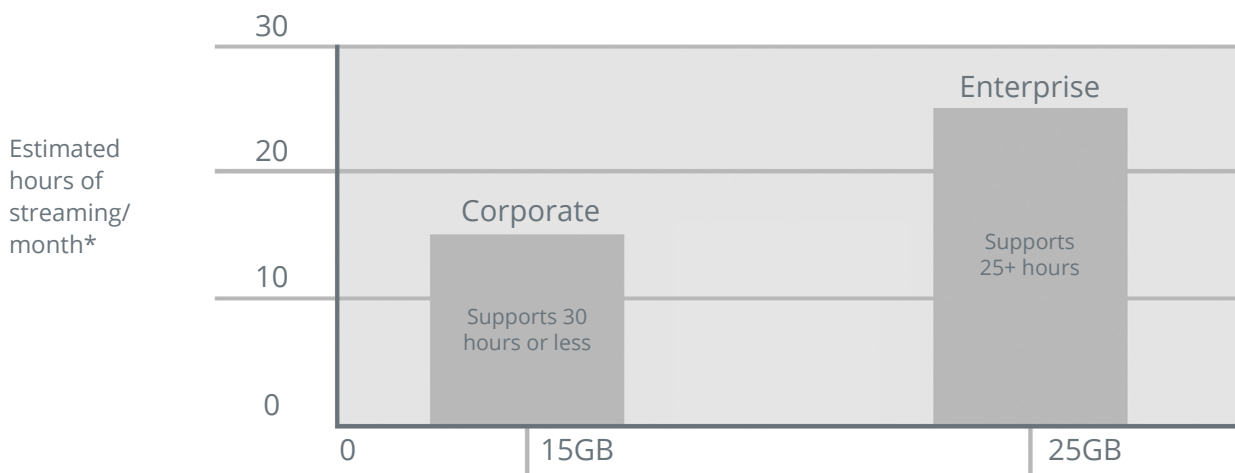

Satcom Direct is the exclusive distribution partner for SmartSky Networks, which includes our world class provisioning and support services. Be among the first to be SmartSky ready by scheduling your installation on light or large business aircraft and selecting an introductory subscription plan to get you onboard.

## SmartSky Key Features

- 4G LTE beamforming-based wireless technology
- More than 10 times the speed and 20 times the bandwidth of the current industry standard ATG network
- SmartSky LiTE™ available for light jets, turboprops
- Multi-GB data throughput
- Real-time content streaming
- VoIP calling with your smartphone
- Video calling and conferencing

## Estimating your monthly data usage

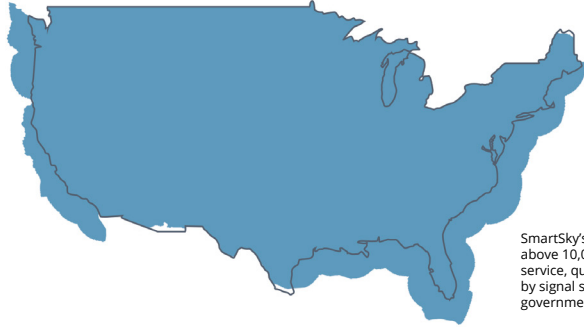

SmartSky delivers a true 4G LTE experience enabling you to stream video in real-time plus talk, text, email, game and surf the web on multiple devices, simultaneously.

Data included with each subscription plan (GB)  
Note: Streaming a good quality video uses roughly 300 MB/hour or more.  
\*Estimated hours are in addition to typical monthly usage.

# SmartSky 4G LTE Nationwide Coverage Plan

SmartSky's engineering team designed our network to typically deliver a rich, 4G LTE in-flight connectivity experience above 10,000ft. SmartSky cannot guarantee service availability within this map of its planned U.S. coverage area. Actual service, quality and availability (including initiation, validation and maintenance of an inflight connection) can be affected by signal strength, aircraft and network traffic volume, service outages, network changes, site rollout sequencing, governmental regulatory changes and other conditions.
